Quite a few of the taller or wider (I am not sure which) transit-oriented development projects that have been built in Toronto are very similar to what is happening to the Queensway right now (I will admit I miss the term transit-oriented). What's new about this project is that it's being built at ground level, rather than underground. Below is a presentation given to the public back in 2010 by the Toronto Transit Commission.Vacuum assisted closure in soft tissue. To show the role of vacuum assisted closure in the management of wounds, fistula and loss of soft tissue in various clinical conditions. A review of the literature in PubMed for articles relating to this topic. Vacuum assisted closure is clinically indicated in patients with open wounds, fistulae, after trauma, and post surgical injury, where initial debridement is required. It can also be of benefit in patients with infected wounds, where the use of topical antimicrobial agents and/or antiseptics may provide adequate control and wound healing. It is used in the setting of wounds occurring in trauma, burns and surgical patients. The system is also useful for patients with chronic wounds. The key aspects to consider when using the device are: the setting of the wound, the bacterial and fungal load of the wound and the benefits of achieving stability to the wound. f678ea9f9e
